

ABSTRACT OF THE DISCLOSURE

5 A medical instrument for transdermally
administering a medicine, in which an ionic medicine or
an ionic medicine-containing substance is sealed in a
bag made of an ion-exchange membrane. The medical
instrument for transdermally administering the medicine
is favorably used for executing the iontophoresis. By
using this medical instrument, an iontophoresis device
10 is realized in a simple structure, inexpensively and in
a small size, which is suited for being carried yet
making it easy to exchange the ionic medicine.
